

SPEAK YOUR WAY TO INCREASE PRODUCTIVITY

Speech Recognition

Your voice can be one of the most powerful tools to increase efficiencies within your document creation process. When you consider that the average person can speak three times faster than he or she can type by conservative estimates. This fact not only makes dictation with integrated speech recognition options a viable work method but it demonstrates that transcribing dictation from scratch is time consuming, not to mention costly. Add in the difficulty and expense of finding experienced and skilled typists it's easy to see why so many organizations are looking for ways of improving productivity and accuracy.

Speech Recognition technology has been in the marketplace for a number of years, and the technology is constantly improving the way we do business, for both large and small organizations.

Winscribe's integrated Speech Recognition provides a flexible platform with the ability to customize your system to provide the maximum productivity. There are additional components within Speech Recognition that cater for all types of businesses, including:

- Multi vocabularies such as US English, UK English, Australian English, Indian English, SE Asian English, German, Spanish, Italian, Dutch and many more to maximize text accuracy
- Over 300,000 pre loaded words in the system dictionary to ensure maximum results
- "Learn as you speak" – Personal dictionaries for the author to add, train and manage to continually improve recognition rates
- Customizable commands to shortcut to commonly repeated words
- Integration with Microsoft Word templates for automatically formatting text

There are two main options available when purchasing

Winscribe's Integrated Speech Recognition Platform additional components include:

- Multiple language vocabularies
- System dictionary
- "Learn as you speak"
- Customizable commands
- Integration with Microsoft Word templates

winscribe **DICTION**

Speech Recognition

integrated Speech Recognition, front end (also known as 'client side' speech recognition) or back end (also referred to as 'server side' speech recognition). With Winscribe you have the ability to choose the method that works best for you, or take advantage of a combination of both.

Client-Side Speech Recognition

Client-side speech recognition is completed and processed on your local PC, and allows the author to:

- View, edit and correct recognized text as you speak for 'on the spot' document creation and completion. The system dictionary contains over 300,000 pre loaded words to ensure maximum results.
- Use voice commands to make edits anywhere in the document quickly and easily.
- Mark the level of self – correction before sending through for typing; choose from Fully Corrected, Partially Corrected or Uncorrected.
- Utilize offline capabilities to dictate anywhere, anytime,

for uploading to the server as soon as a connection becomes available.

Server-Side Speech Recognition

With server-based speech recognition, the speech recognition process is carried out centrally at the server level, and uses the appropriate recognition profile and dictionary to substantially increase the recognition rate:

- One click dictation sending means that no extra training is required for authors as they dictate as per normal so your work practices are completely unaffected.
- As all processing is done on the server, there is minimal impact on PC performance.
- Dictation adaptations are done on the server and then automatically distributed for typing.
- Speech recognition adaptation technology allows corrected typing to be submitted back to the server. In doing so, the engine is automatically 'trained' to update the speakers vocal nuances.

Reduced transcription cost

Greater control of reports for authors

Improved client service

Faster report turnaround times
